

ProQA Update

17 February 2006

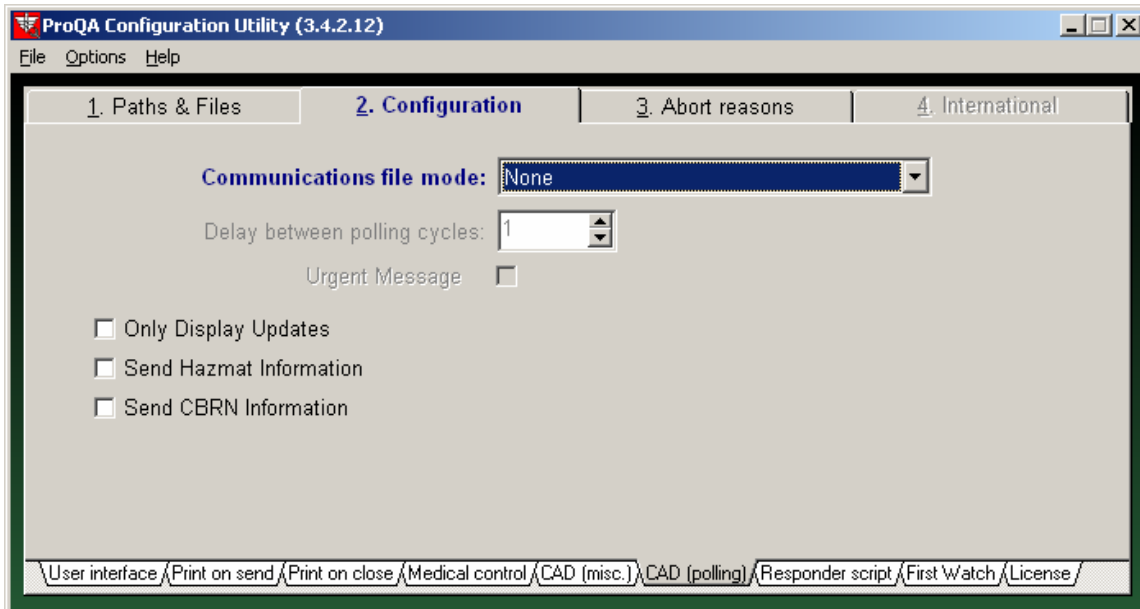

In all protocols of ProQA we have added new functionality that will make it easier for CAD's to retrieve information from the communication file.

In Medical we have added the ability to pass Essential HAZMAT Information, CBRN Surveillance and Severe Respiratory Infection (Flu Like) Symptoms to the Communication file. It can also be configured to only allow updated information to be passed. This will allow for less duplication of information already obtained.

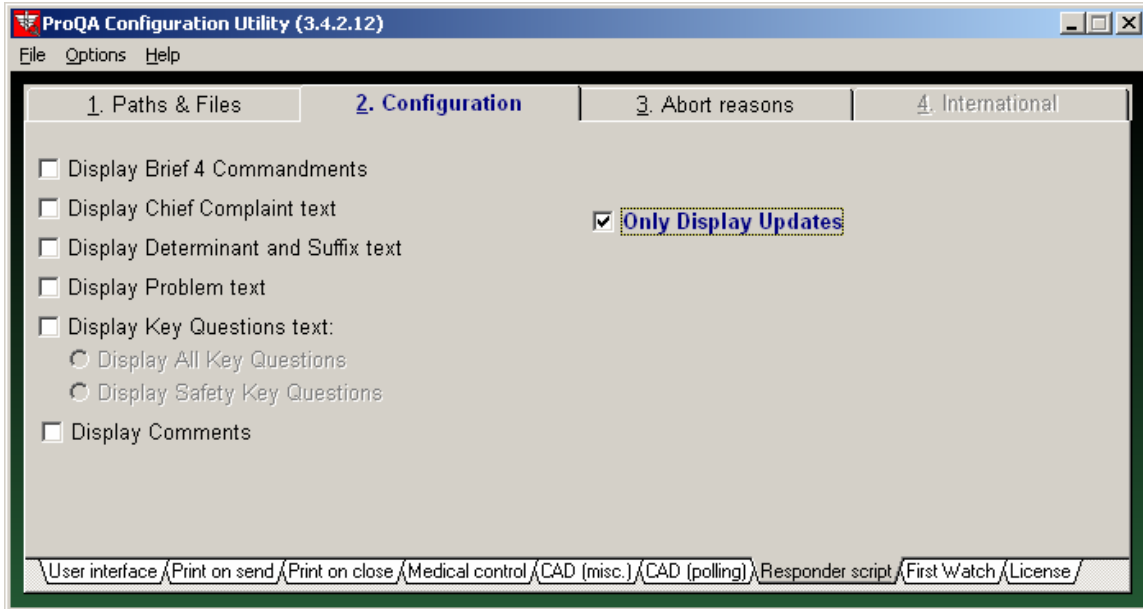

Police and Fire has also had similar functionality added to pass more information back to CAD's. Police can now pass Vehicle Information and Persons Information and Fire can pass Vehicle Description, In-Flight Information and Boat (Vessel) Emergency Information. These new changes can also be configured to only allow updated fields to be passed.

Another Enhancement to the way ProQA passes information to CAD with the Responder Script. ProQA can now be configured to only pass updated responder script information to communication file.

It's easy to enable these new features within ProQA. Open the ProQA Configuration Utility. If you would like to pass Essential HAZMAT Information then you can enable or disable the information you would like passed to the communication file. These new changes can be viewed or edited under Cad (Polling), Configuration Tab. If you only want to send the updated information for Essential HAZMAT Information then you can also enable "Only Display Updates".

Within the Responder script, Configuration tab you can also enable to pass only updated information to the communication file. This change can be seen in ProQA Medical, Fire and Police. To enable just select “Only Display Updates” as seen in the example below.
